

Offline capstone

This module has no graded browser lab

Where to work

- Open the sibling learn Verilator Icarus legacy repository from the monorepo courses folder
- Follow its README and module scripts for a small Verilator plus C++ or Verilog testbench
- The exact target names vary by legacy module, that is normal
- Capture the commands you used and whether the run passed

A typical command shape

- Change into the legacy course root
- You should see compile, build, and run stages complete with a pass or an explainable fail
- Write the command sequence in your notes as if a teammate must replay it tomorrow

What to record

- Note Verilator version, the example name, pass or fail
- If something failed, record the stage, compile, link, or run, and the first error line
- Fixes belong in your notes too; this is practice, not a hidden autograder

Pitfalls to watch

- Do not substitute a browser lab for this offline requirement
- Do not assume one Makefile from a blog matches the legacy tree, read the local README
- Do not skip capturing results; module eleven assumes you attempted a real run
- And if install is broken, fix install before blaming RTL

Your turn

- Complete the offline checklist
- Optional stretch: produce a short trace from the same example
- When you are ready, take the short quiz, then continue to the wrap module
