

Verilator track complete

You now have a working map of Verilator as a tool

Skills you can reuse

- Job-first simulator choice transfers to every new block
- Lint-before-waves saves hours
- The eval-loop mental model survives across designs
- Trace flag plus dump is the wave mantra
- Minimal public markers keep hosts clean
- Metrics vocabulary

Dual-track recap

- If you mainly used browser labs, pick one Track A example and reproduce compile, run
- If you mainly used Track A, revisit any browser lab you skipped for graded challenges
- Confirm you can open the tools index and name where Simulation literacy lives

Where to go next

- For event-delay teaching depth, spend time in learn Icarus, the sibling path
- For protocol bring-up, UART, SPI
- For SystemVerilog language depth, continue learn Verilog modules
- For UVM, climb that ladder when you need constrained-random environments, not before you

Mindset to keep

- Fix RTL before blanket-disabling warnings
- Keep C++ host and SV testbench paradigms straight
- Turn dump on when you need waves
- Mark public only what you must read
- Treat escapes as BLOCKED until addressed
- And remember

Closing

- Check off the wrap checklist
- You finished the learn Verilator path
- Run one small regression or lint-clean example if you want a victory lap
